

Case Story

Problem:

Crown Equipment manufactures heavy-duty lift trucks used in transporting materials and goods in warehouses and distribution centers throughout the world. With corporate headquarters in New Bremen, Ohio, Crown stands as the seventh largest manufacturer of lift trucks in the world. Known for their tradition in design excellence, Crown Equipment takes great pride in their aesthetic appeal. When the lift trucks come from the manufacturing line they need final touch-up sanding and grinding before their final paint. They needed a solution to keep their paint booth clean and particulate free from sanding and grinding dust.

Solution:

Nederman installed a 6 station Nederman High Vacuum System consisting of an E-Pak 300 with automatic valves activated by pneumatic sanders and grinders.

Result:

On-tool dust extraction keeps the working environment free from particulate that could effect the paint booth production. Installed next to the paint booth and provides an easy solution to keep the work area free from hazardous material. The E-Pak performs with the reliability necessary to maintain a clean working environment.
