

## Case Story

---

### Problem:

Tridec, producer of truck components, was opening a new facility which would include an area for welding. Because of the quantity of welding that was performed at once, fume and light pollution was a serious issue for their new facility. Tridec contacted Nederman for a solution to their pollution problem.

### Solution:

Nederman installed (10) Nederman Original Arms with automatic dampers operated by sensor or switch at the hood. A FilterMax 6000 series dust collector with a NIF Fan and 115 kW controlled fan inverter was installed to filter the welding fumes. Tridec was so satisfied with the installation, they are considering (6) more arms.
