## TX 3000

**TX 3000** is an electrically driven filter unit for extraction and filtration of particles, gases and fumes. TX 3000 can be used in a high vacuum system for up to 5 soldering irons with integrated extraction or with two Series 32 extraction arms or down draft grills. The TX 3000 unit is an ESD Safe unit for applications with a demand for static control.

### **Filtration**

The polluted air is filtered in a 3-stage filter, particle, gas and HEPA and recirculated into the room. To increase filter life time and to save energy the unit is supplied with a 12 hours timer. At normal use we recommend filter change once a year.

### **Variable air flow**

TX 3000 has two different settings for airflow, high/low.

### **Accessories**

**Connection Kit** with ½” of 1 ¼” hose and five hose connectors which are used for soldering irons with integrated extraction. The connection kit is available in standard as well as ESD-safe version.

With the two different **Clip on kits** a standard iron is easily equipped with integrated extraction.
