

Protection screening for aluminium car panel repairs

Situation: The customer wants to set up 3 new repair-work stations for aluminium body repairs, mainly for Jaguar cars. They need to segregate the aluminium workbays from the conventional metal work to prevent cross-contamination and to screen off harmful glare from the MIG welding.

Solution: 3 enclosures were built and installed with Nederman Protection Curtains on aluminium Curtain Rail system. Total area enclosed is 18 m by 6 m, which can be screened off as one, two or three bays. This was seen as a good solution, as it can be kept away from the workbay when not required. A Nederman FilterCart was also chosen to provide a flexible solution for the welding fumes.
