

Extraction of welding fumes and grinding dust

Situation: Instroment International n.v. is a Belgium company that designs and manufactures instrumentation for gas stations. They had major problems with welding fumes and grinding dust from 15 welders in separated welding areas doing TIG, MIG and MMA welding on piping.

Solution: We installed 15 units of 4m Nederman 5000 extraction arms supplied with automatic valves. The arms are connected to a FilterMax 9000 equipped with a NCF fan 160/25, Fan Inverter and a summer-winter valve. The customer can during cold periods recover the warm filtrated air. Instroment are very pleased with the filtering result and the clean environment.
